

# SUPER TRAMP

## CASE STUDY

Super Tramp has over 20 year's experience of supplying the British Market with outdoor trampolines and outdoor children's play equipment. Super Tramp design, manufacture and distribute a range of sizes of trampolines and have become extremely well known for quality.

They needed a system that was easy to use in order for them to speed up the time it takes to get a product to market or to produce a new product for a specific customer need. They wanted to have the ability to produce realistic images of new products for a customer without actually having to build it.

SolidWorks has allowed Super Tramp to massively reduce the time it takes to complete a customer order. It has given them the ability to communicate much better with their sister companies in China. It has helped increase sales and reduce manufacturing errors by allowing everyone to visualise how a product should look. They are now able to produce new product ranges easily than ever before.

"SolidWorks has changed our business massively and we are able to do things now that we couldn't even dream of before. SolidWorks has proved to be very reliable and easy to use. It helps us to communicate much better with our international sister companies and has generally helped us all visualise how a new product should look. We are now able to produce new product lines quicker than ever before. I for one could not live without SolidWorks."
